

ArangoML

Data Analytics

Luca Fioravanti Andrea De Angelis

University of Camerino

Academic year: 2020/21

Objectives

- Perform data analysis with graph database and machine learning.
- Investigate ArangoML.

ArangoDB is a native multi-model, open-source database with flexible data models for documents, graphs, and key-values.

Documents -
JSON

Graphs

Key Values

Python is a general-purpose programming language that can be used for a wide variety of applications.

Features:

- Easy to read and to code
- Robust standard library
- Object-oriented and procedure-oriented

Thanks to its popularity, Python has hundreds of different libraries and frameworks focused on Data Analytics and Machine Learning that make it a great choice for Data Scientists.

Pandas is a fast, powerful, flexible and easy to use open source data analysis and manipulation tool written in Python.

Some interesting features are:

- Handling of (Big)data.
- Handling missing data.
- Alignment and indexing.
- Cleaning up data.
- Input and output tools.
- Multiple file formats supported.
- Merging and joining of datasets.
- Visualize and grouping datasets.
- Find unique data.

Scikit-learn (Sklearn) is the most useful and robust library for machine learning written in Python and built upon NumPy, SciPy and Matplotlib.

Provides a selection of efficient tools for machine learning and statistical modeling including:

- Classification
- Regression
- Clustering

Colab(Colaboratory) is a free Jupyter notebook environment that runs entirely in the cloud.

- Write and execute code in Python.
- Create/Upload/Share notebooks.
- Import/Save notebooks from/to Google Drive.
- Import/Publish notebooks from GitHub.
- Import external datasets e.g. from Kaggle.
- Integrate PyTorch, TensorFlow, Keras, OpenCV.
- Free Cloud service with free GPU.

Our case study focused on defining an application use case of ArangoML.

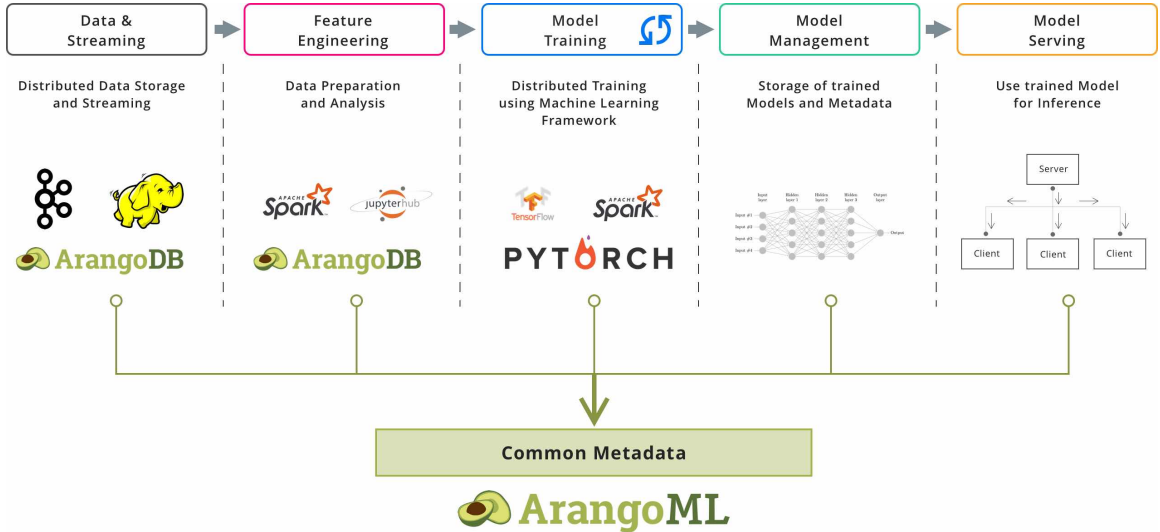

ArangoML allows Data Scientists to manage all information related to their ML pipeline in one place.

Use case:

- Which dataset influences which model?
- What was the performance of that model?

Arangopipe is a ArangoDB API component for tracing meta-data about machine learning projects.

ArangoML

Implementation

We created a Jupiter **notebook** in Colab where we show how machine learning and ArangoDB can work together by creating a knowledge graph and providing missing information using a machine learning model.

Phases:

- Loading dataset.
- Pre-processing.
- Importing in ArangoDB.
- Machine learning.
- Updating ArangoDB.

For our analysis we used an instance of ArangoDB running on the cloud where we saved both the database and the metadata.

By storing machine learning model pipeline thorough Arangopipe in ArangoDB, we can easily keep track of our model updates as well as compare them.

Future implementation

Arangopipe provides a web interface that arranges in a clearer way all the collections created to keep track of your model metadata that we didn't investigate since its not available by the cloud.

The screenshot displays the ArangoML web interface. On the left is a dark blue sidebar with navigation links: Home, User, Deployment, Project, and Query. The main content area is light gray and contains two panels. The 'ML Projects Summary' panel on the left lists project categories: Home_Value_Assessor, Datasets (22), Featuresets (22), Models (22), Experiments (22), and Deployments (22). The 'Search Metadata' panel on the right includes a search bar at the top with the text 'input search text'. Below it, a search filter is set to 'Find: Datasets', 'With: Name', and 'Equal To: Housing_Dataset_2019-06-01 to 2019-07-02'. A 'Search' button and a 'Reset' button are present. Below the search filters is a table with the following data:

No	Description	Name	Tag	Source
1	Housing Price Data	Housing_Dataset_2019-06-01 to 2019-07-02	Housing_Dataset_2019-06-01 to 2019-07-02	Housing Price Operational Data Store

At the bottom of the table, there are pagination controls showing '< 1 >'. The footer of the interface reads 'ArangoML Pipeline ©2019 in Germany'.
